#### Important

Before attempting any external or internal work on the cylinder or any connected components, make sure the cylinder is vented and disconnect the air supply in order to ensure isolation of the air supply.

#### Note

All technical data in this catalogue are typical data only.  
Air quality is essential for maximum cylinder service life (see ISO 8573).

#### WARNING

FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS AND/OR SYSTEMS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

This document and other information from Parker Hannifin Corporation, its subsidiaries and authorized distributors provide product and/or system options for further investigation by users having technical expertise. It is important that you analyze all aspects of your application and review the information concerning the product or system in the current product catalog. Due to the variety of operating conditions and applications for these products or systems, the user, through its own analysis and testing, is solely responsible for making the final selection of the products and systems and assuring that all performance, safety and warning requirements of the application are met. The products described herein, including without limitation, product features, specifications, designs, availability and pricing, are subject to change by Parker Hannifin Corporation and its subsidiaries at any time without notice.

#### SALE CONDITIONS

The items described in this document are available for sale by Parker Hannifin Corporation, its subsidiaries or its authorized distributors. Any sale contract entered into by Parker will be governed by the provisions stated in Parker's standard terms and conditions of sale (copy available upon request).

Reel tensioning

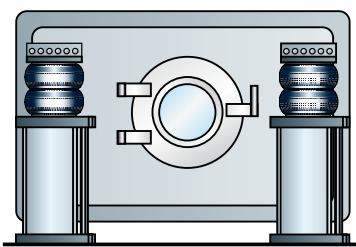

Platform lift

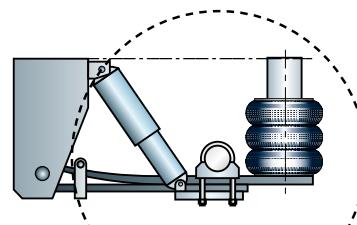

Web tensioning device

**Air Bellows used as an isolator**

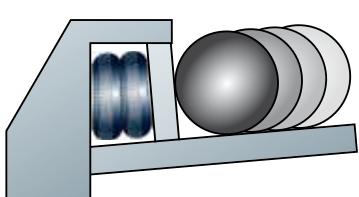

Hopper vibration and damping

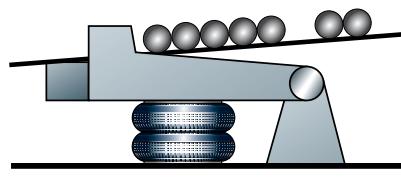

Commercial laundry machine

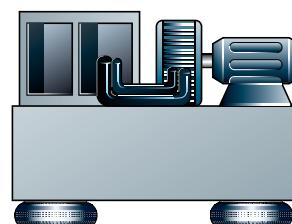

Wheel suspension

Mechanical handling stop

Impact absorption

Machine isolation

# 9109 & SP Air Bellows Series

## Removable and Crimped Types

Air Bellows are the ideal choice for applications requiring short stroke, high thrust single acting actuators. Manufactured from fabric reinforced synthetic rubber in one, two or three convolutions according to stroke and model. They incorporate no reciprocating metal parts and so provide virtually frictionless thrust compared with conventional pneumatic cylinders. All models are single acting only. The return stroke is provided in part by the natural spring action of the bellows but more usually by the load itself. The simplicity of construction provides an extremely long, virtually maintenance-free service life even under arduous conditions. Air Bellows are suitable for vibration applications i.e. device feeders at high frequency.

- **High thrust and frictionless movement**
- **No maintenance or lubrication, oil free**
- **Short stroke for high force application**
- **Easy to install, no precise alignment**
- **Easy to work**
- **Single acting use as a cylinder**
- **High isolation level, use as an isolator**

## Bellows materials

**Standard temperature, natural rubber NR made with NR (natural), SBR (styrolbutadiene), BR (butadiene) elastomers, Carbon Black and Chemical products.**

Natural rubber is an ideal material for industrial applications in or out door.

- Excellent universal properties
- Very high dynamic capability
- Elasticity
- Tensile strength
- Tear resistance
- Abrasion resistance
- For removable and Crimped air bellows types

# NR

**High temperature, chloroprene rubber CR made with NR (natural), SBR (styrolbutadiene), IR (poly isoprene rubber), CIIR (chlorobutyl rubber) elastomers, Carbon Black and Chemical products.**

Chloroprene rubber is mainly characterised by good environmental resistance (weather, ozone, UV, ageing).

- Temperature resistance higher than NR
- Flame retardant
- Limited resistance to mineral oils
- Very high weathering resistance
- For removable air bellows type

# CR

**Higher temperature, epichlorohydrin rubber ECO made with NR (natural), SBR (styrolbutadiene), ECO (epichlorohydrine) elastomers, Carbon Black and Chemical products.**

Epichlorohydrin is a rubber for high temperature applications.

- Resistance to mineral oils and fuels
- Very high continuous temperature resistance
- For removable air bellow type on request

# ECO

## Air Bellows temperature ranges

	Static		Dynamic		-50	-40	-35	-30	-25	-20	0	+70	+90	+100	+115	+120
	min (°C)	max (°C)	min (°C)	max (°C)												
Standard NR	-50	+90														
			-40	+70												
Chlorobutyl CR	-35	+100														
			-25	+90												
Epichlore ECO	-30	+120														
			-20	+115												

## Air Bellows resistances

	NR	CR	ECO
Abrasion	Yes	On request	
Anti freeze agents (ethylene glycol, glycerin)	Yes	Yes	Yes
Fuels	On request		Yes
Mineral or vegetable oils	On request		Yes
Silicone oil	Yes	Yes	Yes
Weak alkalis, soap solution	Yes	Yes	Yes
High concentration of ozone	On request	Yes	Yes
Inorganic acids < 10% and organic acids	Yes	Yes	Yes
Saline solutions, aqueous	Yes	Yes	On request
Water	Yes	Yes	On request

## Bellows construction

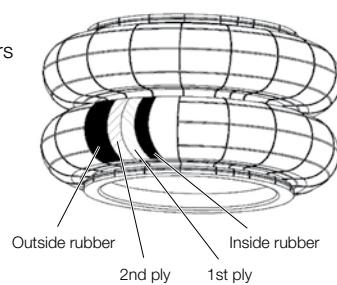

### Bellow rubber consists of:

An Outer & Inner covers rubbers

A first and second plies of reinforced rubber

An inside and outside cover rubber

These plies with cords are at a specific bias angle to one another.

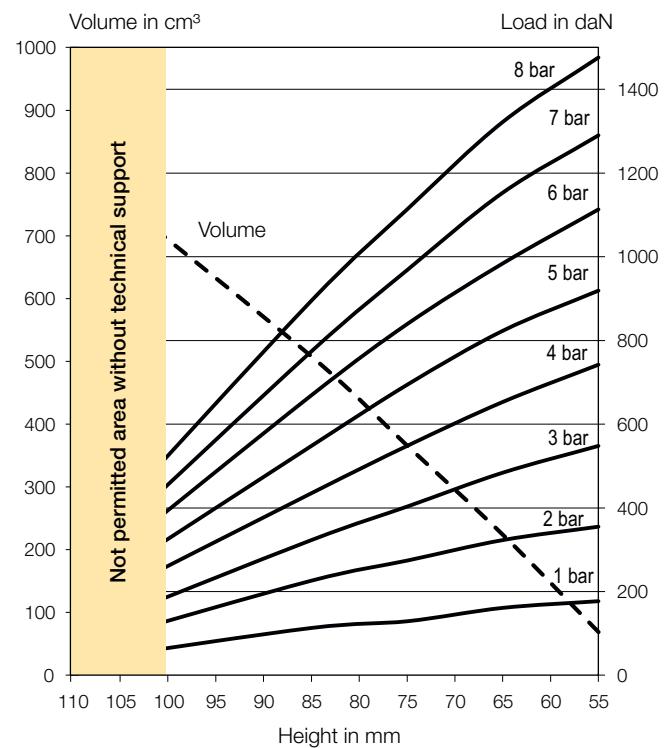

## Choosing the right air bellows for your application

All the important data are shown in the graphs for each air bellows type and size.

The isobars curves, from 1 to 8 bar, gives at a constant working pressure the force over the height (stroke) of the air bellows. The volume curve indicates the volume inside the air bellow at the respective heights. In the gray area there is considerable stress put on the bellow, we recommend not to use it in that section or by consulting your local technical support.

The permitted operating heights are on the X-axis from H minimum to H maximal. The recommended working height H, when the air bellow is used as an actuator, and the recommended working height H2, when the air bellow is used as an isolator, are shown in the chart below each graph. (refer to next pages for more details)

**Adiabatic characteristic curves / Dynamic movements**

### Determining the force for a specific stroke

What is the force of an air bellow with a stroke of 20 mm and a working pressure of 6 bar?

Minimum operating height 55 mm (X-axis right side)

Stroke of 20 mm

$$55 + 20 = 75 \text{ mm}$$

75 < maximum height of 100 mm

Drawn a vertical line through 75 mm height till it intersects the 6 Iso bar curve and then drawn an horizontal line to the right side of the graph to read the force, almost 840 daN

### Determining the volume for a specific stroke

Drawn an horizontal line at the minimum height 55 mm that intersects the volume curve for reading on the left the volume

$$V1 = 85 \text{ cm}^3$$

Do same for height of 75 mm for knowing the volume

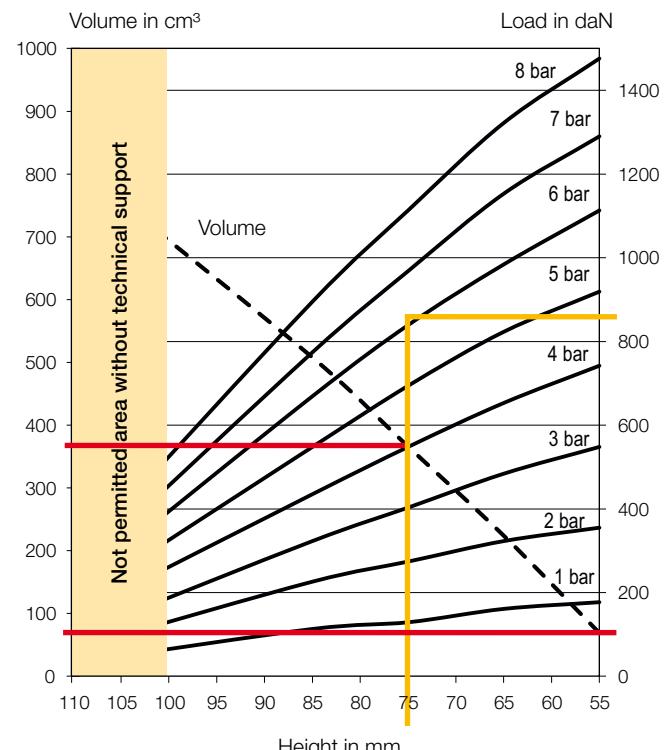

$$V2 = 380 \text{ cm}^3$$

Air consumption

$$L [l] = V2(p2+pa)/pa - V1(p1+pa)/pa$$

$$L = 0,38(4+1)/1 - 0,085(0+1)/1 = 1,81 \text{ litre}$$

**Note!** the thrust of the Air Bellows depends on the height of the bellow. When height increases the thrust decreases because of the change in the effective area of the bellow itself.

## Vibration isolation (damping) when Air Bellows are used as isolators

Air Bellows are an excellent solution to vibration isolation problems. The graph gives natural frequencies at static heights when pressurized at 4 bar and the graph allows the calculation of the percentage isolation at given forcing frequencies.

The basic points which must be considered when selecting an air bellow as an isolator are:

- load or total weight and number of mounting points
- recommended operating height
- degree of isolation
- operating pressure

### Load capability

When selecting the isolator, there should be sufficient load-bearing capability to compensate asymmetric load distribution or excess weight. Air isolators have been designed to absorb dynamic increases in load from operating vibrations.

### Recommended operating height

To ensure optimum isolation and lateral stiffness, isolators should be used at the recommended operating height.

### Operating pressure

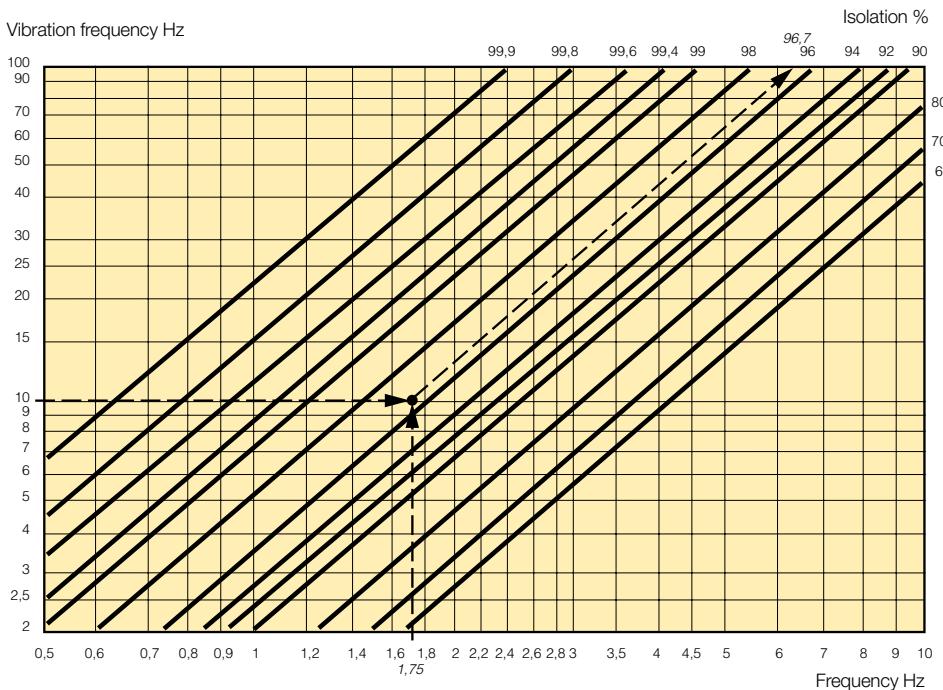

As a rule, the size of the air isolator is correct if the operating pressure is between 4 and 6 bar.

### Degree of isolation

The degree of isolation is a measure of the isolation of vibration excitation. Vibration isolation exists only if the exciting frequency is at least 1.4 times greater than the respective natural frequency.

$$f_e > \sqrt{2} \cdot f_0$$

The degree of isolation can be read from the graph with the parameters natural frequency and exciting frequency. For example, a degree of isolation of 98% means that only 2% of the exciting force is transmitted by the air isolators; 98% of the excitations are isolated.

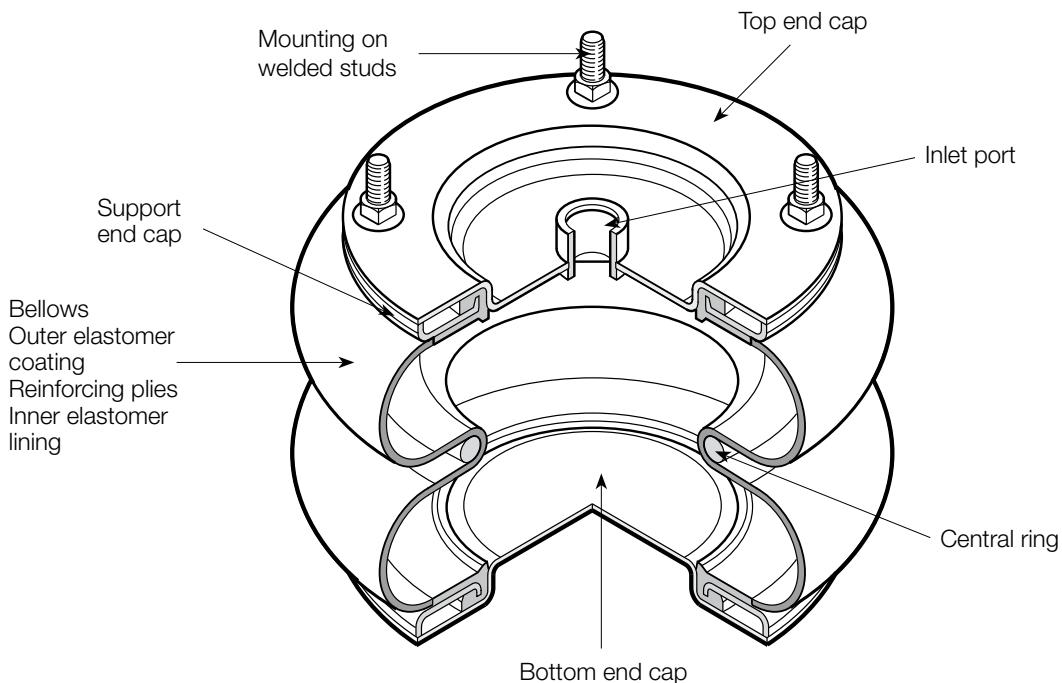

### How damping is calculated in %

1. Search the vertical axis of the graph for the frequency of vibration that requires damping.
2. Search for the loading and size of the unit in the lower table.  
(Note that bellows with twin and triple convolutions give better damping but higher static height.)
3. Having chosen the unit required, select the frequency in Hz on the bottom axis on the graph.
4. Where the lines from steps 1 and 3 intersect, follow the diagonal line up to the top right-hand edge of the graph to find the damping value.

### Example

1. Frequency to be damped = 10 Hz.
2. Loading of Air Bellows unit = 1500 kg.
3. The bellows cylinder in this example has twin bellows, Ø 250 (10" x 2) which, according to the table, gives a frequency of 1.75 Hz at 6 bar.
4. This produces 96.7% damping according to the diagram above.

## **Removable convoluted Air Bellows**

Air Bellows are the ideal choice for applications requiring short stroke, high thrust single acting actuators.

Manufactured from fabric reinforced synthetic rubber in one, two or three convolutions according to stroke and model. They incorporate no reciprocating metal parts and so provide virtually frictionless thrust compared with conventional pneumatic cylinders.

All models are single acting only. The return stroke is provided in part by the natural spring action of the bellows but more usually by the load itself. The simplicity of construction provides an extremely long, virtually maintenance-free service life even under arduous conditions.

Air Bellows are suitable for vibration applications i.e. device feeders at high frequency.

### **Versions**

Air Bellows are available with aluminium, steel end plates or in stainless steel in option. Bellows are in standard a reinforced compound of rubber made in natural, in chlorobutyl or in epichlor in option.

### **Operation**

Due to their flexible construction the mounting of Air Bellows is less critical than with conventional pneumatic cylinders, which normally require rigid fixing and guidance and provide only one axis within a limit of 15° between faces. Additionally the axial location of the end plates may be off set by up to 10 mm.

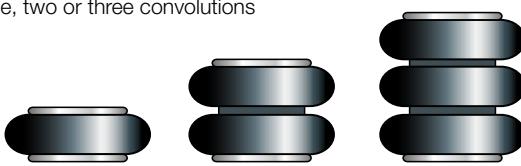

When pressurised Air Bellows will follow the line of least resistance. Accordingly care must be taken with the mounting geometry in angled applications.

When depressurised Air Bellows will fit in to surprisingly small spaces, especially useful for clamping or moving awkwardly shaped or very heavy loads.

In operation it is recommended that the unit is not allowed to "bottom out" or achieve its maximum height. Various mechanical devices may be employed to achieve this.

## Technical specification, removable Air Bellows

- Single acting actuator
- One, two or three convolutions

- The stroke is the difference between minimum and maximum heights.  
The force depends on the stroke.

### Working pressure

- One air port on one end plate.
- Max static pressure 10 bar, working pressure 8 bar, 5.5 to 6 bar recommended for dynamic applications.  
Bursting pressure: 25 to 50 bar (depending on diameter, number of convolutions and type of elastomer).

### Working medium, air quality

- Suitable for operation with compressed air or other gaseous media such as nitrogen.
- Also suitable for use with oil-free compressed air for the foodstuffs industry and in painting plants.
- Reliable even in low-pressure range with hydraulic media such as water or glycol.

### Maintenance

- Free maintenance because no friction due to no part on movement.  
But removable air bellows can be completely dismantled.

## Air Bellows material specification

Ø (mm)	Nb convolution	Type	End caps, clamping ring, central ring			Bellows *		
			Standard	Option stainless steel	Option Other treatment	Natural	Option chlorobutyl	Option epichlor
70	1, 2 & 3	2.3/4 x 1,2 or 3	Aluminium AS9U3	No	No	Compound NR-NBR-SBR	Yes	On request
110 150 **	1, 2 & 3	4.1/2 x 1,2 or 3 6 x 1,2 or 3		Stainless steel 1.4301				
550 660	1 & 2	21.1/2 x 2 26 x 2 ***	Aluminium AS10G	No	No		No ****	No
150 200 250 300 370 410	1, 2 & 3	8 x 1,2 or 3 8 x 1,2 or 3 10 x 1,2 or 3 12 x 1,2 or 3 14.1/2 x 1,2 or 3 16 x 1,2 or 3	Steel DD13 zinc *	Stainless steel 1.4301	On request	Compound NR-NBR-SBR	Yes	On request

Note: 16 x 3 reinforced Air Bellows

\*\* with end caps made in steel DD13 or in aluminium

\*\*\* Steel DD13 zinc

\* Corrosion protection: Zinc alkaline / Passivation Chrome yellow 3 (Chrome free protection 6).

\*\*\*\* On request for 21.1/2 x 2

Resistance to salt spray > 480 hours rust red.

Conformity to ISO 1431-1 for ozone resistance.

## Mountings on end plates

### By threaded holes for

Ø 70, 110, 150, 550, 660

### By external studs for

Ø 150, 200, 250, 300, 370, 410

### Clamping torques for screws and mounting studs

Ø 70 M5: 5 Nm, M6: 7 to 11 Nm

Ø 110 M6: 7 to 11 Nm, M8: 12 Nm

Ø 150 M8 int.: 12 Nm, M10 ext.: 20 to 28 Nm

Ø 200 to 660 M10 int.: 25 Nm, M10 ext.: 20 to 28 Nm

## Recommendations

It is not possible to combine angular misalignment with axial misalignment.

It is imperative that external mechanical stops are used to limit the stroke.

The units should not achieve maximum stroke or be allowed to "bottom out".

Air Bellows may not be stacked, use singly only.

- The thrust of the Air Bellows depends on the height of the bellow.
- When height increases the thrust decreases because of the change in the effective area.
- DO NOT INFLATE the Air Bellow until it is not fixed on the machines with end stops. And so DEFLATE fully the Air Bellows before removing from the machine.
- Take care to put enough clearance around the Air Bellow because of the change in the section under pressure.
- Use the full surface of the end plates to bear the forces.
- Use guidance to avoid any angular or axial misalignments.

## Air Bellows permissible misalignments when Air Bellows are used as actuators

H rec. = recommended installation height |ØN min = minimum space diameter need for installing the Air Bellows

= on request

## Vibration isolation (damping) when Air Bellows are used as isolators

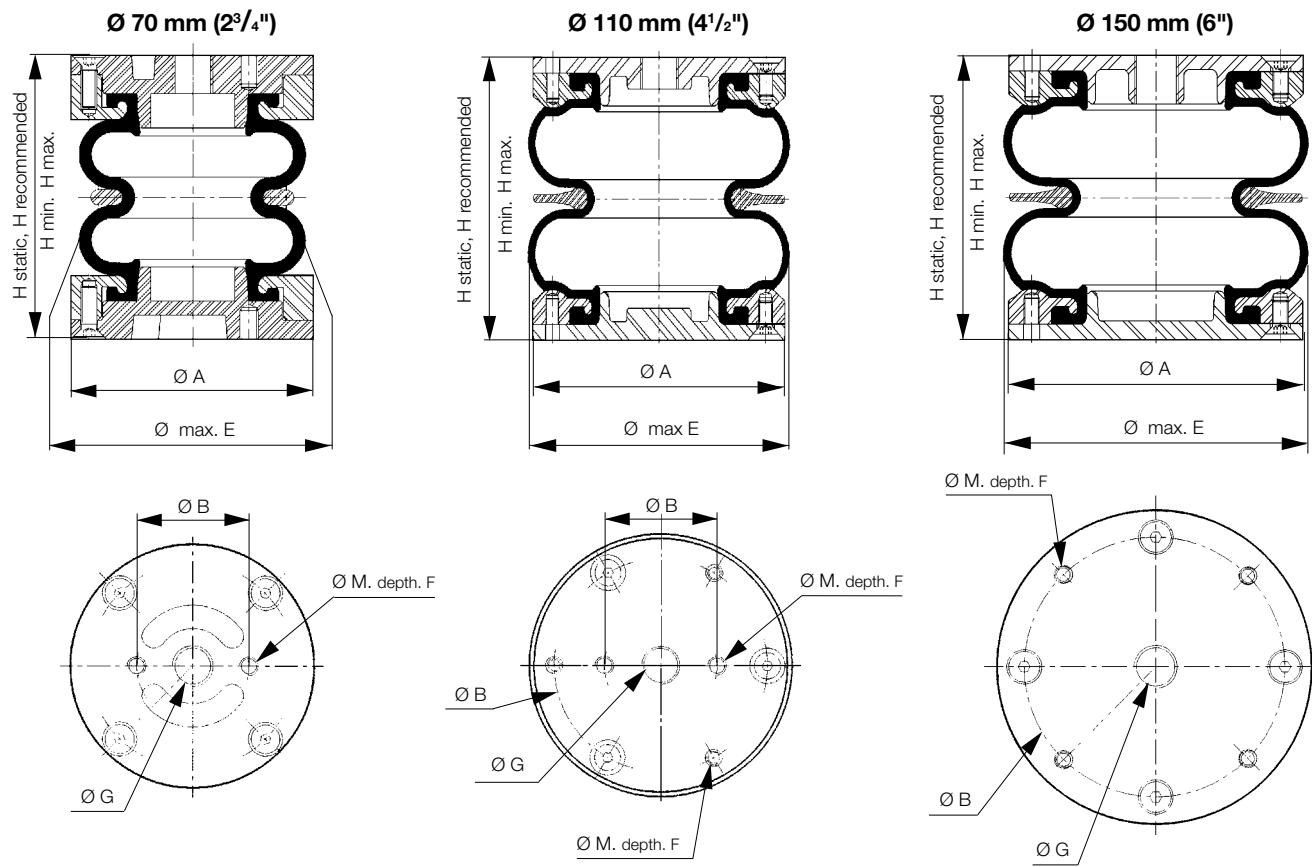

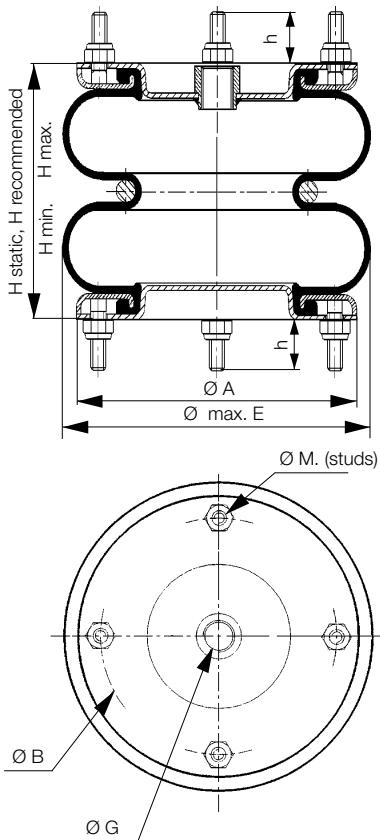

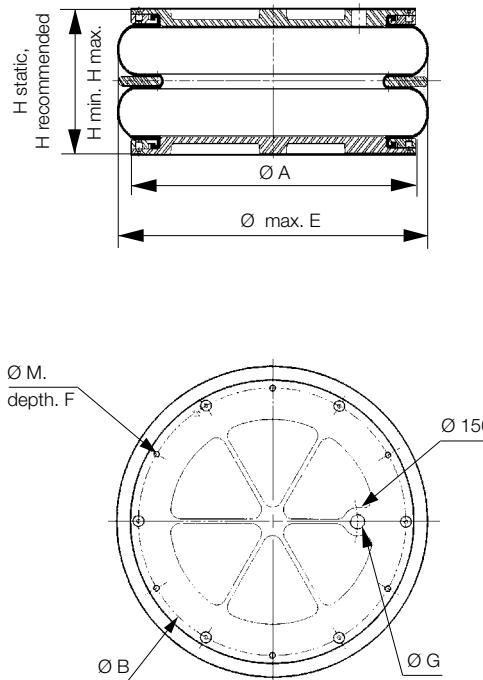

The stiffness is the reaction force that appears when Air Bellow deflects from its initial position.

Due to the compression of air the stiffness is not constant and it is a function of effective area variation, volume and pressure variations.

H2 rec. = recommended installation height for best isolation.

Isolation rate I (%) fe=exciting frequency (Hz) fn=natural frequency (Hz)							$I = 1 - \frac{1}{\left(\frac{fe}{fn}\right)^2 - 1}$		At 2 bar		At 4 bar		At 6 bar		At 0 bar

**Mounting dimensions** (drawn on a 2 convolutions version)**Aluminium end plates version****Steel end plates version**  
Ø 150 to 410 mm (6 to 16")**Aluminium end plates version**  
Ø 550 mm to 660 mm (21<sup>1</sup>/<sub>2</sub> to 26")

## Air Bellows mounting dimensions (mm), removable type

**Note:** High temp, epichlore, stainless steel cup versions have same dimensions

H min, H max, H rec. = recommended installation heights

H2 rec. when air bellows is used as an isolator

F = thread depth for fixing

ØN min = minimum space diameter need for installing the air bellows

It is imperative that external mechanical end stops are used to limit the stroke. The air bellow should not achieve maximum or minimum heights or be allowed to "bottom out". Air bellows may not be stacked, use singly only.

### **Crimped Convoluted Air Bellows**

Air bellows are the ideal choice for applications requiring short stroke, high thrust single acting actuators.

Manufactured from fabric reinforced synthetic rubber in one or two convolutions according to stroke and model.

They incorporate no reciprocating metal parts and so provide virtually frictionless thrust compared with conventional pneumatic cylinders.

All models are single acting only. The return stroke is provided in part by the natural spring action of the bellows but more usually by the load itself.

The simplicity of construction provides an extremely long, virtually maintenance-free service life even under arduous conditions.

Air bellows are suitable for vibration applications i.e. device feeders at high frequency.

### **Operation**

Due to their flexible construction the mounting of Air Bellows is less critical than with conventional pneumatic cylinders, which normally require rigid fixing and guidance and provide only one axis within a limit of 30° between faces. Additionally the axial location of the end plates may be off set by up to 10 mm.

When pressurised Air Bellows will follow the line of least resistance. Accordingly care must be taken with the mounting geometry in angled applications.

When depressurised Air Bellows will fit into surprisingly small spaces, especially useful for clamping or moving awkwardly shaped or very heavy loads.

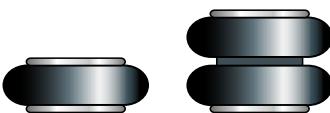

In operation it is recommended that the unit is not allowed to "bottom out" or achieve its maximum height. Various mechanical devices may be employed to achieve this.

### **Versions**

Air bellows are available with steel end plates.

## Technical specification, Crimped Air Bellows

- Single acting actuator
- One or two convolutions, three on request.

- The stroke is the difference between minimum and maximum heights. The force depends on the stroke.

### Working pressure

- One air port on one end plate.
  - Max static pressure 10 bar, working pressure 8 bar, 5.5 recommended for dynamic applications.
- Bursting pressure: 24 to 33 bar (depending on diameter, number of convolutions and type of elastomer).

## Air Bellows material specification

Ø (mm)	Nb convolution	Type	End caps, clamping ring, central ring			Bellows *		
			Standard	Option stainless steel	Option Other treatment	Natural	Option chlorobutyl	Option epichlor
135	1 or 2	6 x 1 or 2						
150	1 or 2	6.1/2 x 1 or 2						
155	2	7 x 2

300	1 or 2	13 x 1 or 2						
350	1 or 2	16 x 1 or 2						

\* Corrosion protection: Zinc alkaline / Passivation Chrome yellow 3 (Chrome free protection 6).

Resistance to salt spray > 480 hours rust red.

Conformity to ISO 1431-1 for ozone resistance.

## Mountings on end plates

### By internal threaded holes for

Ø 135 to 350 M8 12 Nm or M12 20 Nm

### Clamping torques for screws

Ø 135 to 350 M8 12 Nm or M12 20 Nm

## Recommendations

- It is not possible to combine angular misalignment with axial misalignment.
- It is imperative that external mechanical stops are used to limit the stroke.
- The units should not achieve maximum stroke or be allowed to "bottom out".
- Air Bellows may not be stacked, use singly only.
- The thrust of the Air Bellows depends on the height of the bellow.
- When height increases the thrust decreases because of the change in the effective area.
- DO NOT INFLATE the Air Bellow until it is not fixed on the machines with end stops. And so DEFLATE fully the Air Bellows before removing from the machine.
- Take care to put enough clearance around the Air Bellow because of the change in the section under pressure.
- Use the full surface of the end plates to bear the forces.
- Use guidance to avoid any angular or axial misalignments.

## Air Bellows permissible misalignments when Air Bellows are used as actuators

## Vibration isolation (damping) when Air Bellows are used as isolators

The stiffness is the reaction force that appears when Air Bellow deflects from its initial position.

Due to the compression of air the stiffness is not constant and it is a function of effective area variation, volume and pressure variations.

H2 rec. = recommended installation height for best isolation.

Isolation rate I (%) fe=exciting frequency (Hz) fn=natural frequency (Hz)							$I = 1 - \frac{1}{\left(\frac{fe}{fn}\right)^2 - 1}$		At 2 bar		At 4 bar		At 6 bar		At 0 bar

## Air Bellows mounting dimensions (mm), crimped type

H min, H max = recommended installation heights

H rec. = height recommended when air bellows is used as an actuator

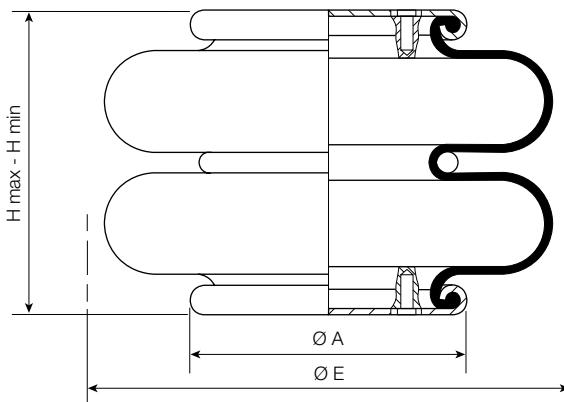

H2 rec. = height recommended when air bellows is used as an isolator

F = thread depth for fixing

ØN min = minimum space diameter need for installing the air bellows

It is imperative that external mechanical end stops are used to limit the stroke. The air bellow should not achieve maximum or minimum heights or be allowed to "bottom out". Air bellows may not be stacked, use singly only.
